Measures of Association

Covariance

Correlation

Measures of Association

Covariance

The covariance measure is susceptible to the unit of measurement, we can arbitrarily inflate or deflate the covariance by choice of units.

Measures of Association

Covariance

$$\text{Correlation} = \frac{\text{Covariance}(X, Y)}{\text{Stdev}(X)\text{Stdev}(Y)}$$

Measures of Association

Covariance

$$\text{Correlation} = \frac{\text{Covariance}(X, Y)}{\text{Stdev}(X)\text{Stdev}(Y)}$$

Excel Command (correlation)

=CORREL(*range1*, *range2*)

Measures of Association

Covariance

- Range: $-\infty$ to $+\infty$
- Affected by the units of measurement.

Measures of Association

Covariance

- Range: $-\infty$ to $+\infty$
- Affected by the units of measurement.

Measures of Association

Correlation

- Range: -1 to $+1$
- Not affected by the units of measurement.

Measures of Association

Correlation

- Range: -1 to $+1$
- Not affected by the units of measurement.

Loosely speaking, correlations $> +0.5$ or < -0.5 are considered indicative of a strong positive or strong negative relationship between two variables.

Measures of Association

Correlation

- Range: -1 to $+1$
- Not affected by the units of measurement.

Loosely speaking, correlations $> +0.5$ or < -0.5 are considered indicative of a strong positive or strong negative relationship between two variables.
